

## **Introduction of an interactive search, allocation and administrative procedure for child care services:EPSA2011071**

*Submitted by Stadt Heidenau*

# Strengths of the project (I)

- This is a truly **innovative**, interactive, service-oriented online software, in the use of which parents themselves are proactively involved. It provides a safe and convenient electronic solution to municipalities in the search, allocation and management of child care services
- The proper handling of issues linked to young children care is of the utmost **social importance** and also political sensitivity for municipalities. Little Bird simplifies matching supply and demand in a interactive way by providing real time access to a database of available facilities.
- The software application appears to be very user-friendly for parents as prospective users of child care services, for child care providers and for the municipality. The interactive approach creates transparency and invites parents to find the solution of their choice.

## Strengths of the project (II)

- The project concerns the creation and implementation of an administrative system and an e-application. Once in place and generating user value it will most certainly become a **sustainable** feature.
- The high **transferability** is included in the very design of the project since its conception. This is an e-administration facility which is replicable in any municipality, and is already praised for that by various actors and institutions. Application is available for other cities and is going to be introduced in two other cities and can be adapted to the needs of other member states.
- The benefit of forward financial and operational planning for the municipality are relatively easy to identify and thus the project has wide political support in the municipality.
